

# TS 38.331: an examination

Milind Kumar V (EE16B025), Kanish B (EE16B106)

# Architecture

# UE STATES

---

At any point in time the UE is in one of the following RRC states

- RRC\_CONNECTED
- RRC\_INACTIVE
- RRC\_IDLE

# RRC\_IDLE

---

- UE specific DRX may be configured by upper layers
  - DRX refers to discontinuous reception
  - Helps UE save power by allowing network to determine when UE can sleep or listen using an RRC message
- UE controlled mobility based on network configuration
  - In the idle mode, the mobility is UE controlled, the UE makes the decision to in which cell it is camping (or tries to camp)

# RRC\_IDLE

---

When in RRC\_IDLE state the UE:

- Monitors Short Messages transmitted with P-RNTI (paging Radio Network Temporary Identifier) over DCI (Downlink Control Information).
  - P-RNTI is a common RNTI used by UE for paging
- Monitors a Paging channel for CN paging using 5G-S-TMSI
- Performs neighbouring cell measurements and cell (re-)selection - In 5G NR, for the procedures such as handover to a stronger cells or adding a new Carrier Component (CC) in the case of CA, it is required to measure the serving cell and neighbor cell signal strength or signal quality matrix
- Acquires system information and can send SI request

# RRC\_INACTIVE

---

- UE specific DRX may be configured by upper layers or by RRC layer
- UE controlled mobility based on network configuration
- UE stores the UE Inactive AS context
- A RAN-based Notification Area (RNA) is configured by RRC layer
  - The UE will perform a RNA update procedure if it moves to a cell which is not part of the current RNA assigned.

# RRC\_INACTIVE

---

When in RRC\_INACTIVE state the UE:

- Monitors Short Messages transmitted with P-RNTI over DCI
- Monitors a Paging channel for CN paging using 5G-S-TMSI and RAN paging using fullI-RNTI
- Performs neighbouring cell measurements and cell (re-)selection
- Performs RAN-based notification area updates periodically and when moving outside the configured RAN-based notification area
- Acquires system information and can send SI request (if configured)

# RRC\_CONNECTED

---

- The UE stores the AS context
- Transfer of unicast data to/from UE
- At lower layers, the UE may be configured with a UE specific DRX
- For UEs supporting CA, use of one or more SCells, aggregated with the SpCell, for increased bandwidth
- For UEs supporting DC, use of one SCG, aggregated with the MCG, for increased bandwidth
- Network controlled mobility within NR and to/from E-UTRA. (refer Procedures section for details)

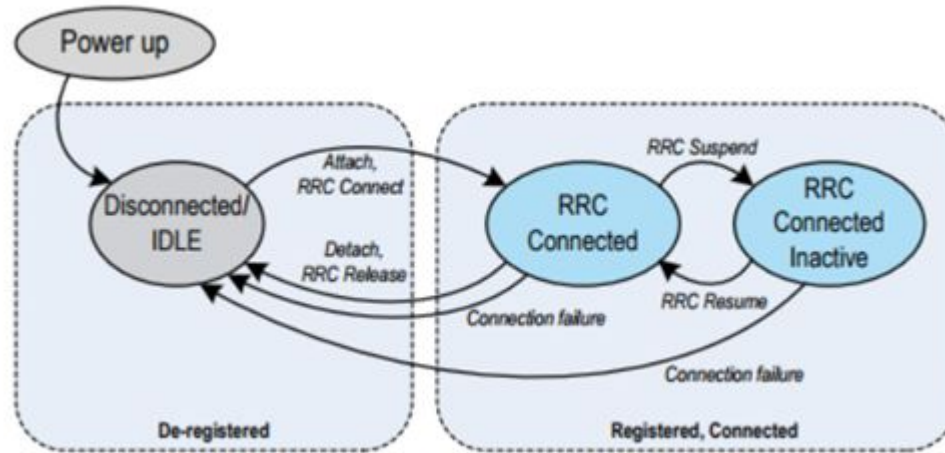

# RRC\_CONNECTED

---

When in RRC\_CONNECTED state the UE:

- Monitors Short Messages transmitted with P-RNTI over DCI, if configured
- Monitors control channels associated with the shared data channel to determine if data is scheduled for it
- Provides channel quality and feedback information
- Performs neighbouring cell measurements and measurement reporting
- Acquires system information.

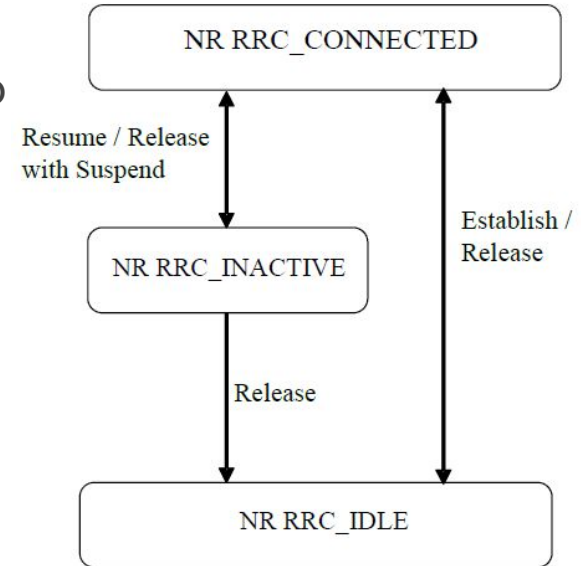

# RRC STATE TRANSITIONS

- When UE is powered up it is in RRC\_IDLE state
- It can move RRC\_CONNECTED with initial attach or with connection establishment
- If there is no activity from UE for a short time, it can suspend its session by moving to RRC\_INACTIVE and can resume its session moving to RRC\_CONNECTED state

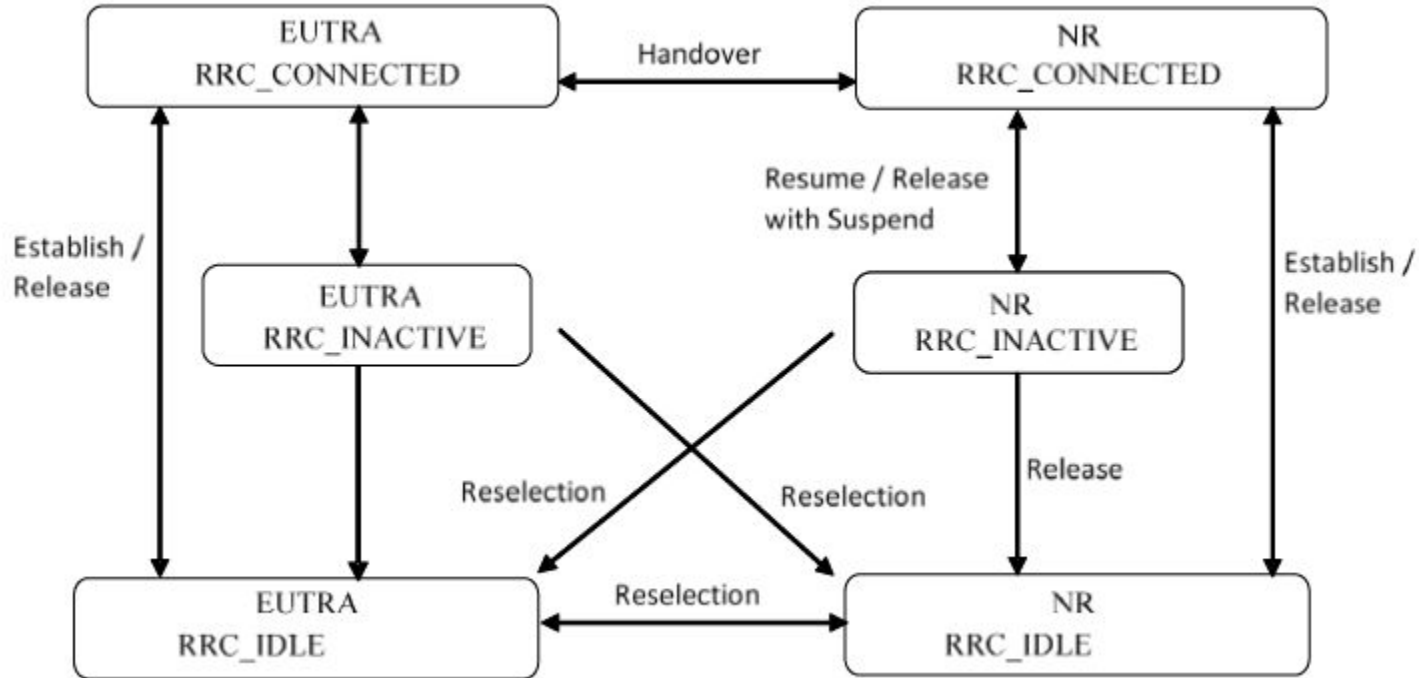

# RRC STATE TRANSITIONS

- **RRC\_CONNECTED:** UE can move to RRC\_IDLE with Connection Release and can move to RRC\_INACTIVE with Connection Release with Suspend
- **RRC\_INACTIVE:** UE can move to RRC\_CONNECTED with Connection Resume and can move to RRC\_IDLE with Connection Release
- **RRC\_IDLE:** UE can move only to RRC\_CONNECTED with Connection Establish

**UE state machine and state transitions in NR**

# NR and E-UTRA RRC STATE TRANSITIONS

UE state machine and state transitions between NR/5GC, E-UTRA/EPC and EUTRA/5GC

# NR and E-UTRA RRC STATE TRANSITIONS

---

- In CONNECTED state Handover can be performed between NR to E-UTRA and E-UTRA to NR.
- In IDLE state NR can Reselect to E-UTRA and E-UTRA can Reselect to NR.
- In INACTIVE state NR can Reselect E-UTRA RRC\_IDLE and E-UTRA can Reselect to NR RRC\_IDLE.

# SIGNALLING RADIO BEARERS

---

Signalling Radio Bearers (SRBs) are defined as RBs that are used only for the transmission of RRC and NAS messages

The 4 SRBs defined in NR are as follows,

- SRB0 is for RRC messages using CCCH logical channel
- SRB1 is for RRC messages (which may include a piggybacked NAS message) as well as for NAS messages prior to the establishment of SRB2 using DCCH logical channel

# SIGNALLING RADIO BEARERS

---

- SRB2 is for NAS messages, using DCCH logical channel and has a lower priority than SRB1 and may be configured by the network after AS security activation
- SRB3 is for specific RRC messages when UE is in (NG)EN-DC or NR-DC, using DCCH logical channel

# Services

# SERVICES PROVIDED TO UPPER LAYERS

---

- Broadcast of common control information
- Notification of UEs in RRC\_IDLE
- Notification of UEs about ETWS and/or CMAS
  - ETWS (Earthquake and Tsunami Warning System) is a warning system in which the primary message is expected to be delivered to subscribers within 4s of generation (see Bibliography)
  - CMAS (Commercial Mobile Alert System) also offers warning messages.
- Transfer of dedicated signalling

# SERVICES EXPECTED FROM LOWER LAYERS

---

- Integrity protection
- Ciphering
- Loss-less in-sequence delivery of information

# Functions

# BROADCAST OF SYSTEM INFORMATION

---

- NAS common information
- Information for UEs in RRC states
- ETWS, CMAS notification

# RRC CONNECTION CONTROL

---

- Paging
- Establishment/modification/suspension/resumption/release of RRC connection, SRBs and RBs
- Access barring
- Initial AS security activation and AS ciphering
- RRC connection mobility
- Radio configuration
- DC and CA cell management
- QoS control
- Recovery from radio link failure

# MEASUREMENT CONFIGURATION AND REPORTING

---

- Establishment/modification/release of measurement configuration
- Setup and release of measurement gaps
- Measurement reporting

# Other functions

---

Other functions include

- generic protocol error handling
- transfer of dedicated NAS information
- transfer of UE radio access capability information
- Inter-RAT mobility

# Procedures

# RAN

- Stands for Radio Access Network.
- Exists between the UE and [Core Network](#).
- Handles radio-related functionality including radio-resource handling, retransmission protocols, coding, and various multi-antenna schemes.
- Examples include GRAN, GERAN, UTRAN and E-UTRAN.
- E-UTRA is the [air interface](#) (consisting of physical and data link layers) for LTE.

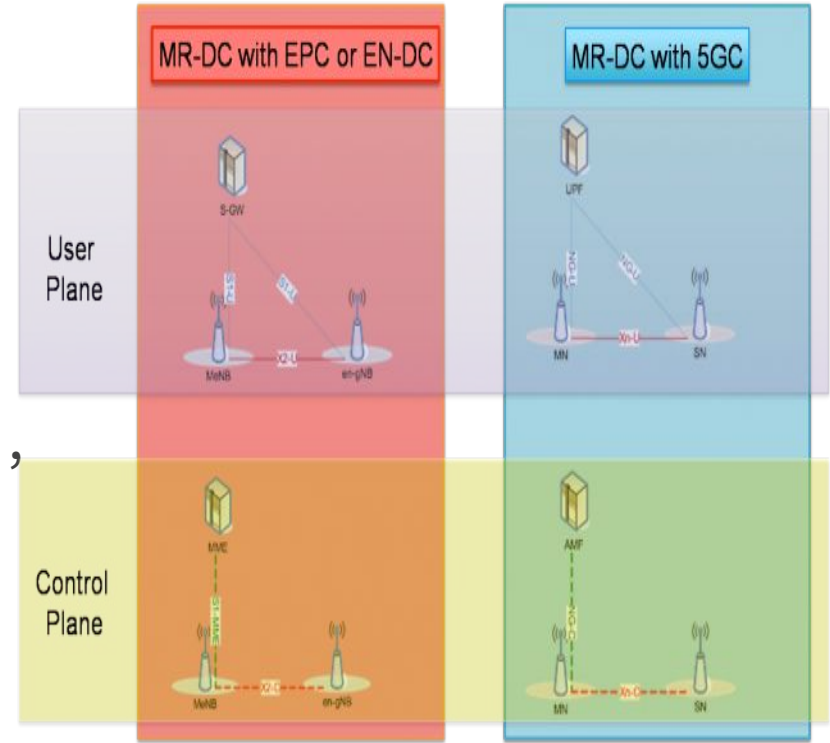

Source: [Wikipedia](#)

# MR-DC

---

- Stands for Multi-RAT Dual Connectivity.
- It is possible to connect NR RAN to the LTE core network.
- This helps increase data rates, reliability, improve load-balancing and reuse LTE infrastructure.

Source: [4G 5G World](#)

# MR-DC

---

The UE is considered to be in MR-DC if it is in one of the following situations

- EN-DC
- NGEN-DC
- NE-DC
- NR-DC

# MR-DC

---

	MasterNode	SecondaryNode	RAN	CoreNW
EN-DC	eNB	gNB or engNB	EUTRAN	EPC (corresponds to LTE)
NE-DC	gNB	eNB or ngeNB	NG-RAN	5GC
NGEN-DC	eNB or ngeNB	gNB	NG-RAN	5GC
NR-DC	gNB	gNB	NG-RAN	5GC

- **gNB** (generalized NodeB): logical 5G radio node, handles radio communications with 5G UE, uses 5G air interface, may connect to EPC or 5GC
- **eNB** (E-UTRAN NodeB): 4G LTE equivalent of gNB
- **ngeNB** (next generation eNB): communicates with 5G UE, uses 4G LTE air interface, connects to the 5G core network.
- **engNB**: used in EUTRA dual connectivity, acts as secondary node

# UE requirements for MR-DC

---

- UE state in EN-DC and NGEN-DC depends on the IE `nr-SecondaryCellGroupConfig`. Core network needs to be selected appropriately.
- UE is in NE-DC if `mrdc-SecondaryCellGroup` is set to `eutra-SCG`.
- UE is in NR-DC if `mrdc-SecondaryCellGroup` is set to `nr-SCG`.

# UE requirements for MR-DC

- `mrdc-SecondaryCellGroup` is an information element in the `RRCReconfiguration` message.

```

RRCReconfiguration-v1560-IEs ::= SEQUENCE {
  mrdc-SecondaryCellGroupConfig SetupRelease { MRDC-SecondaryCellGroupConfig } OPTIONAL, -- Need M
  radioBearerConfig2 OCTET STRING (CONTAINING RadioBearerConfig) OPTIONAL, -- Need M
  sk-Counter SK-Counter OPTIONAL, -- Need N
  nonCriticalExtension SEQUENCE {} OPTIONAL
}

MRDC-SecondaryCellGroupConfig ::= SEQUENCE {
  mrdc-ReleaseAndAdd ENUMERATED {true} OPTIONAL, -- Need N
  mrdc-SecondaryCellGroup CHOICE {
    nr-SCG OCTET STRING (CONTAINING RRCReconfiguration),
    eutra-SCG OCTET STRING
  }
}

```

## ***mrdc-SecondaryCellGroup***

Includes an RRC message for SCG configuration in NR-DC or NE-DC.

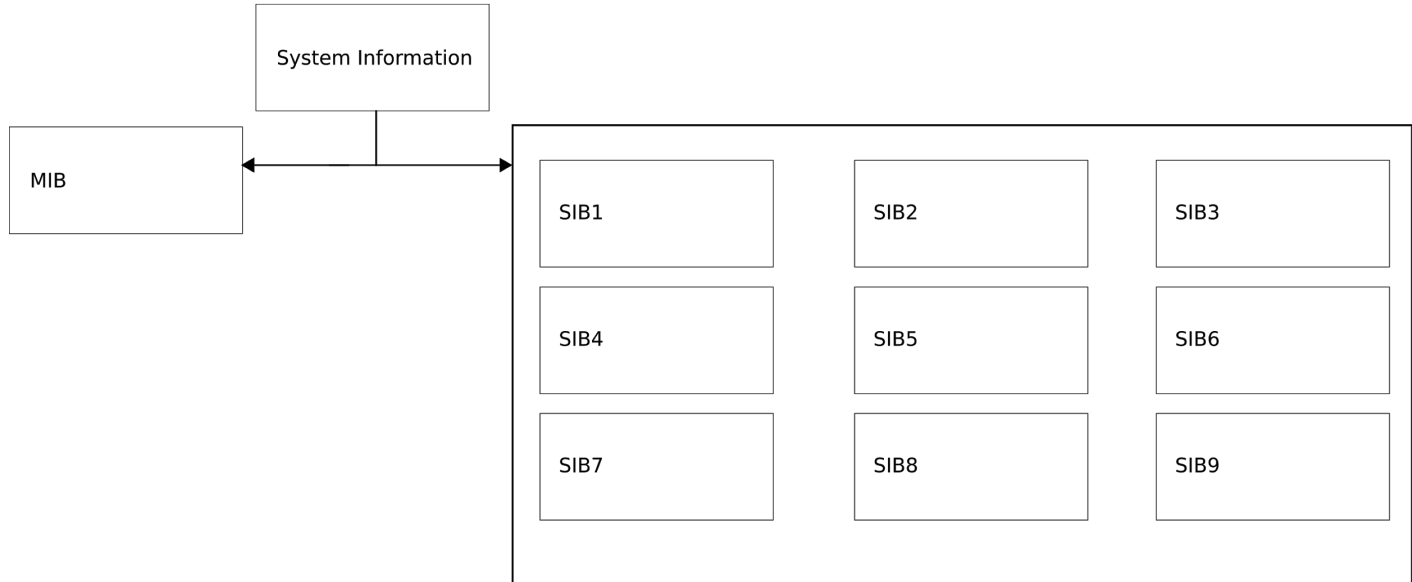

For NR-DC (nr-SCG), *mrdc-SecondaryCellGroup* contains the *RRCReconfiguration* message as generated (entirely) by SN gNB. In this version of the specification, the RRC message can only include fields *secondaryCellGroup* and *measConfig*.

For NE-DC (eutra-SCG), *mrdc-SecondaryCellGroup* includes the E-UTRA *RRCConnectionReconfiguration* message as specified in TS 36.331 [10]. In this version of the specification, the E-UTRA RRC message can only include the field *scg-Configuration*.

# System Information Acquisition

# System Information

System refers to all the common information that a device needs in order to properly operate within the network.

# MIB

---

- MIB stands for the Master Information Block.
- Transmitted on BCH with a periodicity of 80ms.
- Expected to remain same for this duration and for all the SS blocks in the SS burst set.
- Contains a small amount of information required by UE to obtain the remaining system information.

## MIB

```

-- ASN1START
-- TAG-MIB-START

MIB ::= SEQUENCE {
    systemFrameNumber      BIT STRING (SIZE (6)),
    subCarrierSpacingCommon  ENUMERATED {scs15or60, scs30or120},
    ssb-SubcarrierOffset    INTEGER (0..15),

```

# UE's acquisition of System Information

- NAS (Non-access stratum)
  - Maintains communication as UE moves.
  - Protocol for messages between UE and core nodes
- AS (Access stratum)
  - Handles data transport over the wireless connection and manages radio resources.

# MIB acquisition by UE

# MIB acquisition by UE

---

BCCH (Broadcast Control Channel) configuration

Name	Value	Semantics description	Ver
SDAP configuration	Not used		
PDCP configuration	Not used		
RLC configuration	TM		
Logical channel configuration	Not used		

# MIB acquisition by UE

---

## BCCH (Broadcast Control Channel) configuration

- SDAP (Service Data Adaptation Protocol)
  - Transfers User Plane data
  - Maps [QoS flow](#) and data radio bearer for UL and DL.
- PDCP (Packet Data Convergence Protocol)
  - Part of the protocol stack above the RLC layer.
  - Services RRC and user plane upper layers.
  - Handles transfer of user and control plane data, ciphering, header compression, etc.

# MIB acquisition by UE

---

BCCH (Broadcast Control Channel) configuration

- RLC (Radio Link Control)
  - Layer 2 Radio Link Protocol between MAC and PDCP layers.
  - Refer 38.322 for more details.
- Logical channel
  - MAC provides services to the RLC via logical channels.
  - These are either control or traffic channels.

# MIB acquisition by UE

---

T311: a UE timer. Can be specified by the IES below.

The IE UE-TimersAndConstants contains timers and constants used by the UE in RRC\_CONNECTED, RRC\_INACTIVE and RRC\_IDLE.

## *UE-TimersAndConstants* information element

```

-- ASN1START
-- TAG-UE-TIMERSANDCONSTANTS-START

UE-TimersAndConstants ::=          SEQUENCE {
    t300          ENUMERATED {ms100, ms200, ms300, ms400, ms600, ms1000, ms1500, ms2000},
    t301          ENUMERATED {ms100, ms200, ms300, ms400, ms600, ms1000, ms1500, ms2000},
    t310          ENUMERATED {ms0, ms50, ms100, ms200, ms500, ms1000, ms2000},
    n310          ENUMERATED {n1, n2, n3, n4, n6, n8, n10, n20},
    t311          ENUMERATED {ms1000, ms3000, ms5000, ms10000, ms15000, ms20000, ms30000},
    n311          ENUMERATED {n1, n2, n3, n4, n5, n6, n8, n10},
    t319          ENUMERATED {ms100, ms200, ms300, ms400, ms600, ms1000, ms1500, ms2000},
    ...
}

T311	Upon initiating the RRC connection re-establishment procedure	Upon selection of a suitable NR cell or a cell using another RAT.	Enter RRC_IDLE

# MIB acquisition by UE

---

`intraFreqReselection`: a field in the MIB

## *intraFreqReselection*

Controls cell selection/reselection to intra-frequency cells when the highest ranked cell is barred, or treated as barred by the UE, as specified in TS 38.304 [20].

- If set to “allowed”, the UE may select another cell on the same frequency if re-selection criteria are fulfilled. The barred cell is excluded as a candidate for cell selection/reselection for 300 seconds.
- If set to “not allowed”, the UE can not select another cell on the same frequency. The UE excludes the barred cell and the cells on the same frequency as a candidate for cell selection/reselection for 300 seconds.

# MIB acquisition by UE

---

cellBarred: an IE in MIB

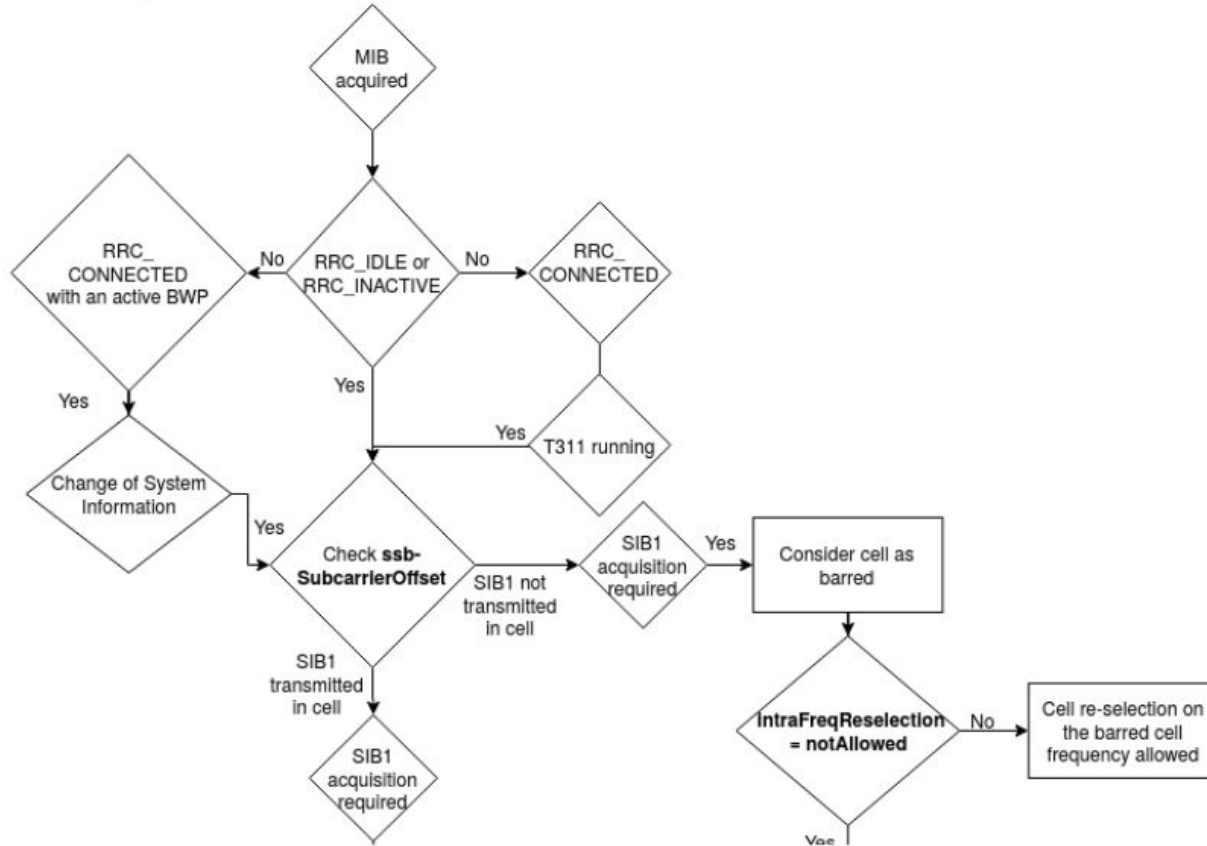

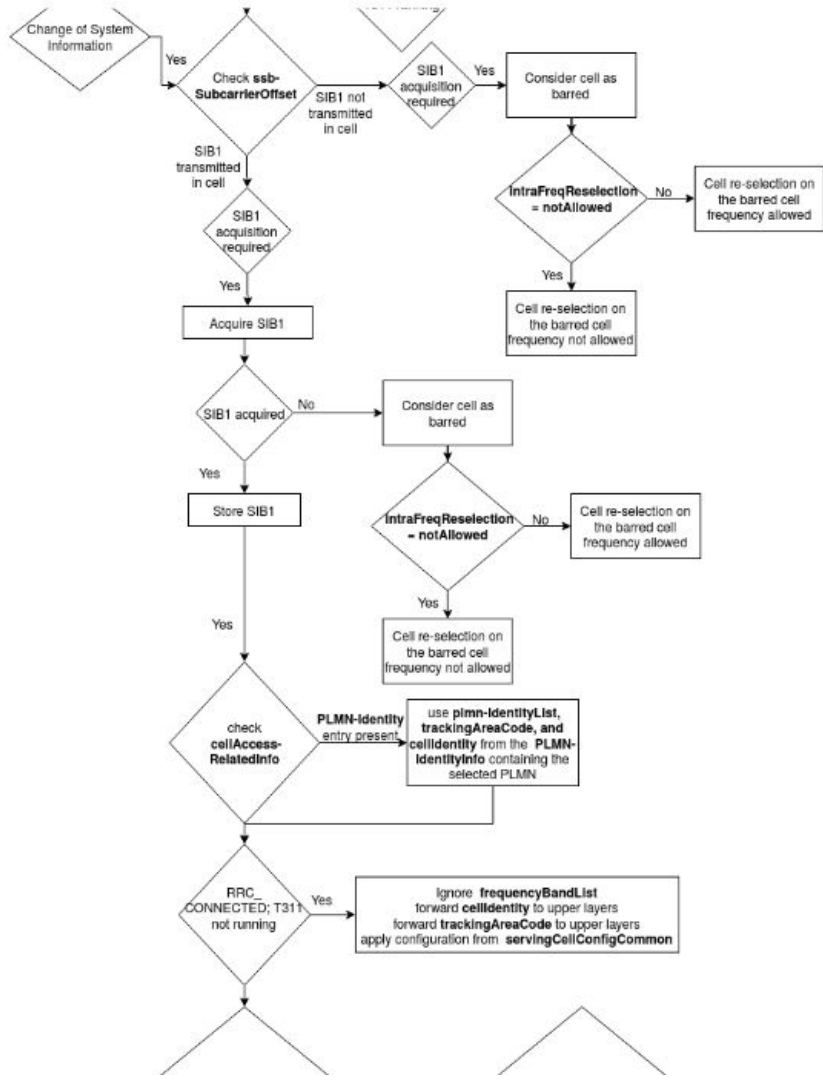

## *cellBarred*

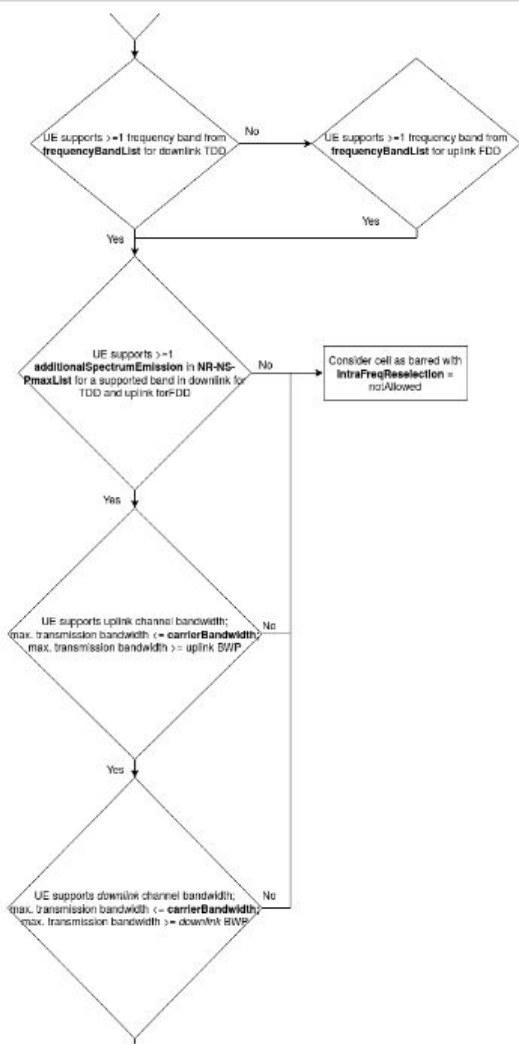

Value *barred* means that the cell is barred, as defined in TS 38.304 [20].

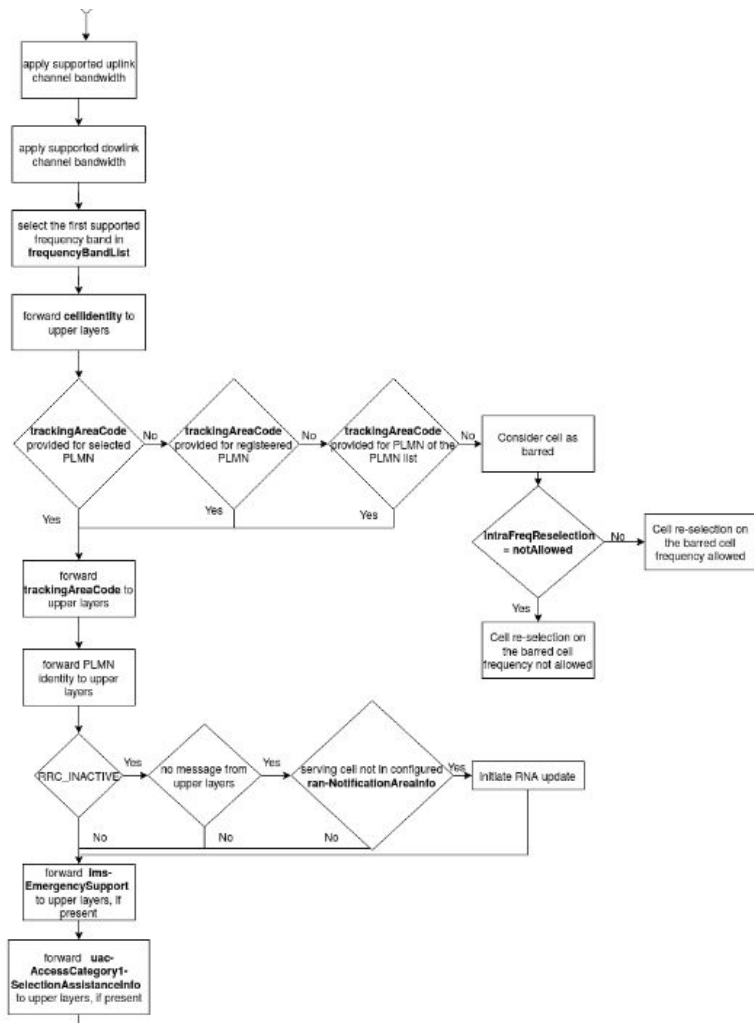

- A Barred cell is one that a UE is not allowed to camp on.
- It can not even be used for emergency calls.

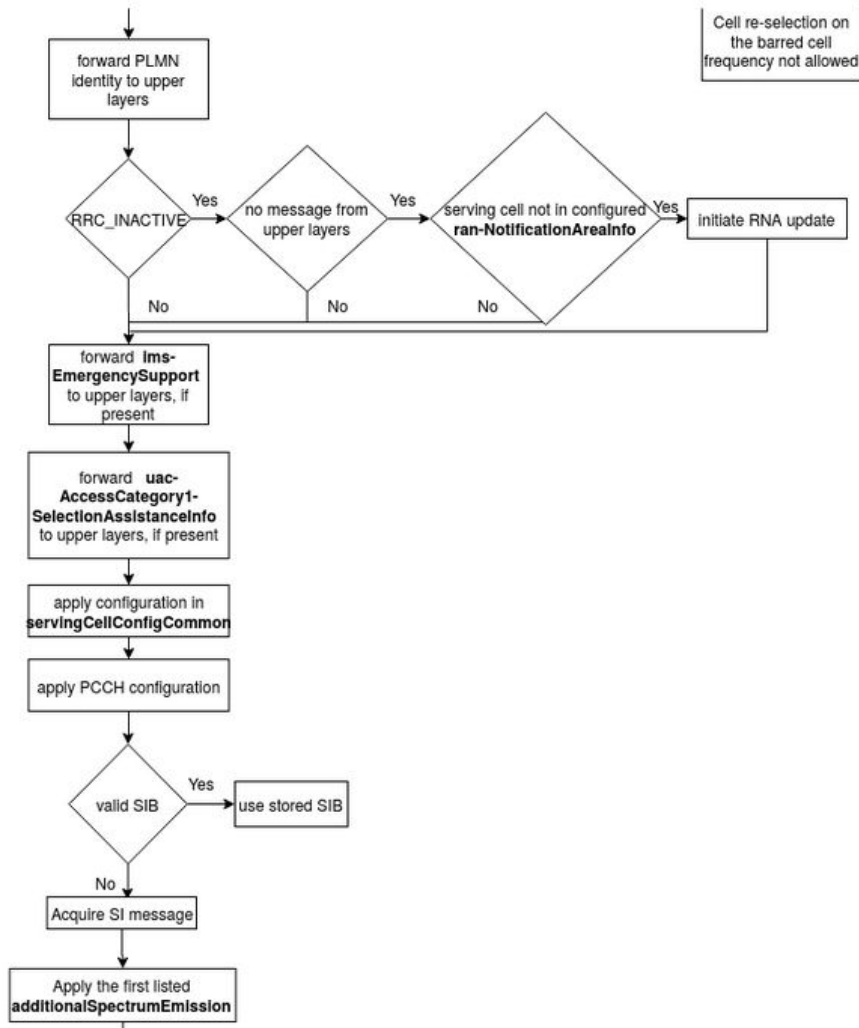

# Acquisition of SIB1

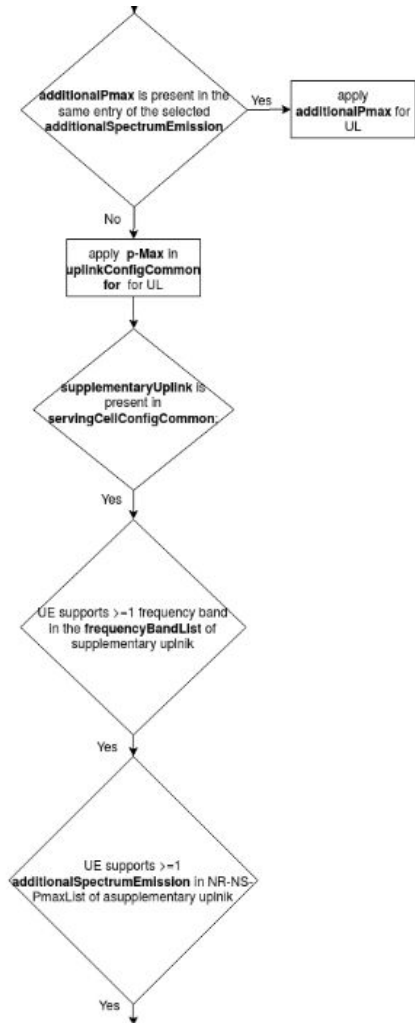

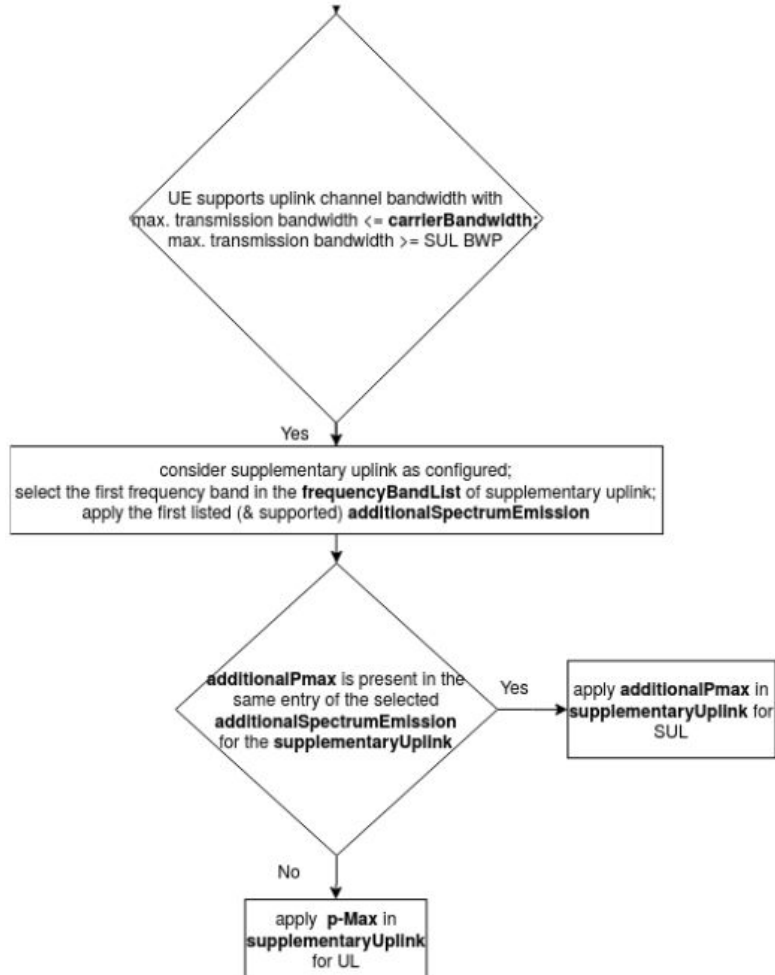

# SIB1 acquisition

ssb-SubcarrierOffset: an IE in the MIB.

```

-- ASN1START
-- TAG-MIB-START

MIB ::=
    SEQUENCE {
        systemFrameNumber      BIT STRING (SIZE (6)),
        subCarrierSpacingCommon ENUMERATED {scs15or60, scs30or120},
        ssb-SubcarrierOffset    INTEGER (0..15),
    }
  
```

## **ssb-SubcarrierOffset**

Corresponds to  $k_{SSB}$  (see TS 38.213 [13]), which is the frequency domain offset between SSB and the overall resource block grid in number of subcarriers. (See TS 38.211 [16], clause 7.4.3.1).

The value range of this field may be extended by an additional most significant bit encoded within PBCH as specified in TS 38.213 [13].

This field may indicate that this cell does not provide *SIB1* and that there is hence no CORESET#0 configured in *MIB* (see TS 38.213 [13], clause 13). In this case, the field *pdcc-ConfigSIB1* may indicate the frequency positions where the UE may (not) find a SS/PBCH with a control resource set and search space for *SIB1* (see TS 38.213 [13], clause 13).

Presence of CORESET for Type0-PDCCH CSS set

- Present if  $k_{SSB} \leq 23$  for FR1
- Present if  $k_{SSB} \leq 11$  for FR2

# SIB1 acquisition

---

cellAccessRelatedInfo: an IE in SIB1

  ...
}
-- TAG-CELLACCESSRELATEDINFO-STOP
-- ASN1STOP

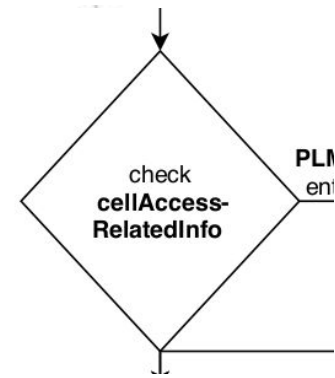

```

# SIB1 acquisition

---

cellAccessRelatedInfo: an IE in SIB1

## CellAccessRelatedInfo field descriptions

### **cellReservedForOtherUse**

Indicates whether the cell is reserved, as defined in 38.304 [20]. The field is applicable to all PLMNs.

### **plmn-IdentityList**

The *plmn-IdentityList* is used to configure a set of *PLMN-IdentityInfoList* elements. Each of those elements contains a list of one or more PLMN Identities and additional information associated with those PLMNs. The total number of PLMNs in the *PLMN-IdentityInfoList* does not exceed 12. The PLMN index is defined as  $b_1+b_2+\dots+b_{(n-1)}+i$  for the PLMN included at the  $n$ -th entry of *PLMN-IdentityInfoList* and the  $i$ -th entry of its corresponding *PLMN-IdentityInfo*, where  $b(j)$  is the number of *PLMN-IdentityInfo* entries in each *PLMN-IdentityInfo*, respectively.

- Reserved cell: Camping is not allowed on this cell. Only certain UEs can camp on this cell (determined by the System Information). Exceptions are
  - UE has an ongoing emergency call.
  - UE camped on a cell belonging to a registration area that is forbidden for regional provision of service

# SIB1 acquisition

PLMN (Public Land Mobile Network): a combination of wireless communication services offered by a specific operator in a specific country.

## PLMN-Identity information element

```

-- ASN1START
-- TAG-PLMN-IDENTITY-START

PLMN-Identity ::= SEQUENCE {
    mcc          MCC          OPTIONAL,          -- Cond MCC
    mnc          MNC
}

MCC ::= SEQUENCE (SIZE (3)) OF MCC-MNC-Digit
MNC ::= SEQUENCE (SIZE (2..3)) OF MCC-MNC-Digit
MCC-MNC-Digit ::= INTEGER (0..9)

-- TAG-PLMN-IDENTITY-STOP
-- ASN1STOP

```

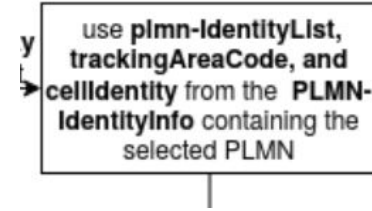

### PLMN-Identity field descriptions

<b><i>mcc</i></b>	The first element contains the first MCC digit, the second element the second MCC digit and so on. If the field is absent, it takes the same value as the <i>mcc</i> of the immediately preceding IE PLMN-Identity. See TS 23.003 [21].
<b><i>mnc</i></b>	The first element contains the first MNC digit, the second element the second MNC digit and so on. See TS 23.003 [21].

Conditional Presence	Explanation
<i>MCC</i>	This field is mandatory present when PLMN-Identity is not used in a list or if it is the first entry of PLMN-Identity in a list. Otherwise it is optionally present, Need S.

# SIB1 acquisition

---

**trackingAreaCode**: IE in **PLMN-IdentityInfoList**, used to identify a tracking area within the scope of a PLMN

## **PLMN-IdentityInfoList** information element

```
-- ASN1START
-- TAG-PLMN-IDENTITYINFORLIST-START

PLMN-IdentityInfoList ::=
    SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::=

cellIdentity: used to identify a cell in within a PLMN.

## *PLMN-IdentityInfoList* information element

```
-- ASN1START
-- TAG-PLMN-IDENTITYINFORLIST-START

PLMN-IdentityInfoList ::=          SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::=             SEQUENCE {
  plmn-IdentityList                SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-Identity,
  trackingAreaCode                  TrackingAreaCode                               OPTIONAL,      -- Need R
  ranac                             RAN-AreaCode                               OPTIONAL,      -- Need R
  cellIdentity                      CellIdentity,
```

## *CellIdentity* information element

```
-- ASN1START
-- TAG-CELLIDENTITY-START

CellIdentity ::=                  BIT STRING (SIZE (36))

-- TAG-CELLIDENTITY-STOP
-- ASN1STOP
```

# SIB1 acquisition

---

## Additional IEs

- **additionalSpectrumEmission:** used to indicate emission requirements to be fulfilled by the UE (see TS 38.101-1 and TS 38.101-2)
- **NR-NS-PmaxList:** used to configure a list of additionalSpectrumEmission for a given frequency band
- **ims-EmergencySupport:** part of SIB1, presence indicates that the cell supports IMS emergency bearer services for UEs in limited service mode
- **p-Max:** used to limit the UE's uplink transmission power on a carrier frequency

# SIB1 acquisition

---

Additional IEs

- **carrierBandwidth:** width of the carrier in number of PRBs (can be specified separately for UL and DL)
- **uac-AccessCategory1-SelectionAssistanceInfo:** part of SIB1, used to determine whether Access Category 1 applies to the UE
- **servingCellConfigCommon:** part of SIB1, gives configuration of the serving cell
- **uplinkConfigCommon:** provides common uplink parameters of a cell

# Other SIBs

---

- SIB2, SIB4, SIB6, SIB7, SIB8 require action from the UE on being received.
- SIB3, SIB5, SIB9 do not require anything of the UE unless specified elsewhere.
- This system information acquired by the procedures detailed above is used for UE uplink transmission and PRACH.
